

PHASE 7 – PROJECT DOCUMENTATION

1. Project Documentation Overview

The project documentation provides a complete description of the Script-Controlled ACL project implemented in ServiceNow. It explains the purpose of the project, requirements, design, implementation, testing, and final outcome.

The documentation is prepared to provide a clear understanding of how Script-Controlled ACLs are used to restrict access to student records based on user roles and branch values.

2. Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

3. Project Purpose

The purpose of this project is to implement Script-Controlled ACLs in ServiceNow to control access to student records based on user roles and branch values.

The system allows authorized users to access permitted records while restricting unauthorized access.

4. Technologies and Platform Used

Platform – ServiceNow

Access Control – ACL

Scripting – ServiceNow ACL Script

Data Table – Student Records

Access Method – Role and Branch-based Access

ServiceNow Platform – Build Anywhere

5. Main Project Components

The main components implemented in the project are:

- Users and Roles
- Student Records table
- Branch-based student records
- Read ACL
- Write ACL
- Create ACL
- Delete ACL
- Script-controlled access conditions
- Administrator access
- Access verification

User List – User Management

User ID	Name	Email	Active	Created	Updated
abel.tutor	Abel Tutor	abel.tutor@example.com	true	2012-02-17 19:04:52	2024-09-26 20:19:25
abraham.lincoln	Abraham Lincoln	abraham.lincoln@example.com	true	2013-07-23 17:15:54	2024-09-26 20:19:29

6. Project Implementation Summary

The project was implemented by first creating the required users and roles. A Student Records table was then created with branch information.

Records for different branches such as ECE, EEE, and CSE were added.

Script-Controlled ACLs were configured for Read, Write, Create, and Delete operations. The ACL scripts check the required access conditions before allowing users to perform the requested operation.

7. Access Control Documentation

The project uses ACLs to control different operations:

- Read ACL – Controls viewing of records.
- Write ACL – Controls modification of records.
- Create ACL – Controls creation of records.
- Delete ACL – Controls deletion of records.

The access decision is based on the configured user role and branch conditions.

Delete ACL – Security Rule Verification

ACL Configuration – Role and Security Attribute

8. Testing Documentation

Testing was performed using different users and roles.

The following areas were verified:

- Branch-based record access.
- User role-based permissions.
- Read operation.
- Write operation.
- Create operation.
- Delete operation.
- Administrator access.
- Unauthorized access restriction.

Screenshots of the configuration and testing results can be included as supporting evidence.

9. Screenshots and Evidence

The following screenshots are included as supporting evidence from the project. Actual screenshots from the project are used.

10. Final Project Outcome

The completed project provides controlled access to student records using Script-Controlled ACLs.

The system controls access according to the user's role and the branch value of the record. Different operations such as Read, Write, Create, and Delete are controlled through ACLs.

Administrators are provided with the required full access, while unauthorized access is restricted.

11. Conclusion

The project successfully demonstrates the practical implementation of Script-Controlled ACLs in ServiceNow. It provides an understanding of how user roles and field values can be used to control access to records and protect information from unauthorized access.
